- (22) We consider only the case where the intermolecular interaction potential is short ranged, such as for the Lennard-Jones potential.
- (23) Hernandez, R.; Somer, F. L. *J. Phys. Chem. B* **1999**, *103*, 1064. Hernandez, R. *J. Chem. Phys.* **1999**, *111*, 7701.
- (24) The validity of this assumption is based on MD simulations which show that the autocorrelation time of the random force,  $\tau_f$ , is rather insensitive to both bulk and local densities (in homogeneous and inhomogeneous fluids, respectively), whereas, on the other hand, the magnitude,  $\eta$ , is very sensitive to density changes.

- (29) Song, W.; Biswas, R.; Maroncelli, M. *J. Phys. Chem. A* **2000**, *104*, 6924.
- (30) Technically, one would have to assume a fast relaxation down to a state having the same intermolecular interactions as does the ground state for our subsequent analysis, which assumes that the ground state  $P_{eq}(\rho)$  controls the MTSGLE parameters, to apply to this thought experiment.
